Question No: 37 (Marks: 3)

Elaborate Rester Graphics with examples.

A raster graphics image, digital image, or bitmap, is a data file or structure representing a generally rectangular grid of pixels, or points of color, on a computer monitor, paper, or other display device.

To illustrate the matter further - here's the letter "J":

J

Look closely at it... Take a magnifying glass to it if you like. You see a "J", the computer sees something more like this, where '.' represents a zero and 'X' represents a one:

....X

....X

....X

....X

....X

....X

....X

X...X

X...X

.XXX.

Where you see a zero, the computer instructs its video hardware to paint the current background color. A one calls for the current foreground color. Yes, it is actually a bit more complicated, but it all basically boils down to one bit or the other making a distinction

between the colors of adjacent pixels, which together form an image.

Question No: 38 (Marks: 5)

What are the important properties, methods and event handlers of image object?

The primary use of the image object is to download an image into the cache before it is needed to display , image object can be used to create different kinds of animations or to display one of several images based on

the desired requirement , in java script image object can be used to display the required pre loaded image

Properties of image object is : height , width ,hspace ,vspace , src , name border etc

Methods :none

Event handlers:on abort , onload, onerror etc

Question No: 39 (Marks: 5)

Function sum odd numbers(maxnumber){var sum=0;

For(i=0; <maxNumbers;l++)

```
{  
{  
if(i / 2 == 1 || i == 1)  
sum += i;  
}  
  
return sum;  
  
}
```

Question No: 41 (Marks: 10)

write a note on each of the following:

a. Vector or Object-Oriented Graphics:

b. Bit-Mapped or Raster Graphics:

A:In Vector or object oriented graphic everything drawn is treated as object. objects retain their identity after they are drawon. these objects can later be moved, stretched, duplicated, deleted,etc. they are resolution independent and have relatively small file size. the examples are: swf, svg, wmf, ps

brass_ibrahim: Vector graphics is the use of geometrical primitives such as points, lines, curves, and shapes or polygon(s), which are all based on mathematical equations, to represent images in computer graphics.

brass_ibrahim: The term "vector graphics" is mainly used today in the context of two-dimensional computer graphics. Virtually all modern 3D rendering is done using extensions of 2D vector graphics techniques. Virtually all modern 3D rendering is done using extensions of 2D vector graphics techniques

B:Bit-Mapped or Raster Graphics:

Treats everything that is drawn as a bit-map

If an object is drawn on top of another, it is difficult to move just one of them while

leaving the other untouched

Changing the resolution often requires considerable touch-up work

Relatively large file size

Examples: gif, jpg, bmp

masood.tariq: Bit-Mapped or Raster Graphics:

- Object Relational database

The data should be divided and save in multiple table and tabular form ,so that open ,searching ,sorting ,editing and saving of data can be performed quickly. With tabular form one can sort w.r

Question No: 41 (Marks: 10)

How can we neutralize DoS attack? Can we track the attacker?

Ans: Denial of service attempt to make a computer resource unavailable to its Intended user . Easiest way to survive an attack is to have planned for the attack. Good contact with ISP and some security providers and CERT are essential also having a separate emergency block of IP address for Critical servers with a separate rout can be effective.

We should use genuine operating system can also be helpful.

By using an extremely stateful packet filter that will inexpensively drop any unwanted packet surviving DoS attack Becomes much Easier.

We can also use Fierwalls .

Using Antivirus softwear

Using private net work

Using encryption

Network Sniffer

Intrusion detector By using all these techniques we can neutralize DoS Attack

Investigative process should begin immediately after the DoS Attack begins.

By using IP address we can Track Attacker.

Question No: 39 (Marks: 5)

Explain function arguments with the help of an example?

Function is a group of statements which is defined once in a web page and can be used repeatedly. It is also known as procedure, subprograms and subroutine. By using functions codes becomes easier to understand and number of lines are also reduced. It is easy to maintain a function because we make a single change in a function and it reflects on multiple locations.

It is a comma separated list of data. It defines interface between the web page and the function. Arguments values are passed to the function by value or by reference. It should be defined in the HEAD portion of Web pages before called up.

Example:

```
Function add( a, b ) {
```

```
  c = a + b ;
```

```
  return c ;
```

```
}
```

```
sum = add( 2, 4 ) ;
```

```
document. write( sum ) ;
```

Question No: 40 (Marks: 10)

What is Data Integrity? How can we ensure it (any three ways) ? (4+6)

Data integrity is the maintaining, consistency and correctness of the data. Consistency means there should be no conflict between data items and correctness is the freedom of error. It means there should be no error in the given data. Data should be interrelated also and easy to access the required data.

There are many ways to integrate data.

1. Limit Integrity: By limiting the values of data items to specified ranges to prevent illegal values. Age of person should not be negative is the best example.
1. Type Integrity is enforced by specifying the type of a data item. Using credit cards we need to enter exactly 12 digits. More are less are not allowed.
1. Referential Integrity is implemented by an item referenced by the data for some other item and it must exist in the database. Reservation of a flight is the example.
